Space Weather Technical Forecast

Issued on Monday, 25 October 2021 at 01:27 Local

This technical forecast provides a four day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

Space Weather Forecast Headline: Daily Slight Chance of M-class flares.

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity was Very Low through the period, with only B-class flares observed. There have been three numbered sunspots on the disc: the first, AR2886 a simple unipolar Hsx/Alpha group near the solar meridian, with this spot stable and inactive. The second, AR2887, is larger and more complex, currently a single spot group but almost appearing as a pair of spots, though their plage regions and magnetic fields are intertwined. This is Dki/Beta-gamma, with further development evident in its intermediary spots. The final spot, AR2888, has just rotated onto the southeastern limb, currently a simple Axx/Alpha.

All observed CMEs in available satellite imagery were peripheral - mostly from behind the eastern limb - with no Earth-directed components.

Solar Wind / Geomagnetic Activity: The solar wind, as measured by DSCOVR at L1, was at background levels throughout, ranging between 330 km/s to 380 km/s. The solar wind density was initially average, with a peak around 10ppcc, then fell to below average from 24/1900UTC. The IMF Bt was weak, at 6nT or below, and the north-south component was subsequently weak ranging from -6/+5 Bt. The phi angle remained predominantly negative (towards the sun). Resultant geomagnetic activity was Quiet (Kp 0-2).

Energetic Particles / Solar Radiation: The high energy proton flux (greater than 10MeV) as measured by GOES-16 was at Background levels, with no solar radiation storms observed. High energy electron flux (greater than 2MeV) was predominantly at background levels. Associated 24-hour electron fluence was well below the Active (1e8 integrated pfu) threshold, with 1.36e6 integrated pfu recorded at 25/0000UTC.

Four-Day Space Weather Forecast Summary

Solar Activity: There is a daily Slight Chance of M-class flares, largely the result of the complexity of AR2887, although this has yet to be borne out in observed X-ray activity. There is a possible returning region just over the northeast limb that may yet increase probabilities over the next few days, however these do not yet feature in the percentages.

Solar Wind / Geomagnetic Activity: No Earth-directed CMEs feature in this forecast period. CH15/+ is expected to become geoeffective sometime late on Day 3 (27th) or early on Day 4 (28th). Due to its positive orientation and given it remains connected to the northern polar crown, an slight enhancement of solar wind speeds is possible, perhaps bringing brief Unsettled or Active intervals on Days 3 or 4 in an otherwise Quiet geomagnetic period.

Energetic Particles / Solar Radiation: The high energy (greater than 10 MeV) proton flux is expected to remain at Background levels, with no solar radiation storms currently expected. The high energy electron flux (greater than 2MeV) is likely to remain at Normal Background levels, with the 24-hour fluence expected to remain well below Active.

Geomagnetic Storms:

No CMEs are expected to affect Earth during the period. CH15/+, a southern extension of the northern polar crown, is expected to become geoeffective sometime late on 27th or early 28th October. Though the STEREO A PLASTIC data measurements 3 days ago show a slow solar wind environment for the period, there are several gaps within the data, with the possibility that CH15/+ may bring a slight enhancement to solar winds, perhaps bringing brief unsettled or active periods. The risk of any minor geomagnetic storms remains at nominal levels through the period.

Geo-Magnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	1	1	3	5
Strong	G3	No	1	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X-Ray Flares:

There is a daily Slight Chance of M-class flares. This is largely the result of sunspot region AR2887 in the southeast quadrant, which currently is assessed as having Dki/Beta-gamma complexity and continues to show a slight growth trend. The prospects for significant X-ray activity may increase later in the period however, as there is a bright flux region lying to the northeast limb which has been the subject of several CME's over the past few days. This may bolster the flare risk as it rotates onto the visible disk in the next couple of days. The risk of significant flares is held at a daily Slight Chance for M-class and a non-zero risk of X-class due to AR2887 alone.

X Ray Flares	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC)	Day 2 (00-24 UTC)	Day 3 (00-24 UTC)	Day 4 (00-24 UTC)
Probability			(%)	(%)	(%)	(%)
Active	R1-R2 M Class	No	10	10	10	10
Very Active	R3 to R5 X Class	No	2	2	2	2

Solar Radiation Storms - (High Energy Protons):

With no significant sunspots in geoeffective positions on the Sun, solar radiation storms are currently not expected.

Radiation Storms Probability (Exceedance)	Level (cm^{-2} sr^{-1} s^{-1})	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	**≥ S1**	No	1	1	1	1
Very Active	**≥ S3 ***	No	1	1	1	1
* S3 ≥ 10 MeV ≥ 1000 pfu and / or ≥ 50 MeV ≥ 10 pfu. (pfu = $cm^{-2}sr^{-1}s^{-1}$)						

High Energy Electrons Event (≥ 2MeV):

The high energy (greater than 2 MeV) electron flux is currently at Normal Background levels, with no further enhancements expected in the four-day forecast period sub-Active fluence should persist throughout.

GEO Electron Environment Probability (Exceedance)	Level (cm^{-2} sr^{-1} day^{-1})	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	**≥ 2 MeV ≥ $1x10^8$**	No	1	1	1	1
Very Active	**≥ 2 MeV ≥ $1x10^9$**	No	1	1	1	1
